

**2015 ANNUAL REPORT TO THE ECOLOGICALLY RELATED SPECIES WORKING GROUP  
(ERSWG)**

**REPUBLIC OF INDONESIA**

**RESEARCH CENTER FOR FISHERIES MANAGEMENT AND CONSERVATION  
AND  
DIRECTORATE GENERAL OF CAPTURE FISHERIES**

**1. Introduction**

Southern bluefin tuna (*Thunnus maccoyii*) was caught as bycatch of Indonesia tuna longline vessel targeting bigeye tuna and yellowfin tuna operating in the Indian ocean but mostly within Indonesia Fisheries Management Area 573. As bycatch, SBT is caught within the whole year as reflected in the following graph:

From the average catch within five (5) years as reflected in the above graph, we can conclude that monthly catch is fluctuated, but tend to increase from July up to February and decreasing from February to June yearly.

This report includes information on Ecologically Related Species (ERS) of Indonesia tuna longline fisheries collected by scientific observers on-board updated to 2013 and 2014.

## **2. Review of SBT Fisheries**

Indonesia has developed its tuna fisheries since 1970s, but for southern bluefin tuna catch recording was initiated appropriately since 2008, and in fact that hundreds of Indonesia longline vessels had SBT catch record. Since 2008, Indonesia has become a full member of the Extended Commission of CCSBT and agreed on its national quota of 750 tons/year. During 2011-2014, Indonesia annual catch were more than its national quota, that it may be resulted from the involvement of hundreds of small-scale tuna longline vessels in this SBT fisheries. From 2015, Indonesia started to allocate quota to each company through three (3) associations, and there are 17 companies having received its own quota. In this scheme, each company has to submit the list of their vessel greater than 30 GT authorized to fish for SBT and those vessels have also to be included on the CCSBT Record of Vessel Authorized to Fish for SBT. And there are 211 tuna longline vessels greater than 30 GT have been listed as authorized vessels to fish for SBT. To support the effective implementation of this scheme, Indonesia has developed an Application System of CDS and will be fully operated from January 2015. Under this system, quota allocation for each company will be controlled automatically at the time of submission of CDS form for its validation. In this system, CDS form for validation has to be submitted this on-line system.

In addition to that, there are about 305 small-scale longline vessels (smaller than 30 GT) that are possible to catch SBT, of which 120 out of them have been included on the CCSBT Record of Vessel Authorized to Fish for SBT. In fact, SBT is un-intended bycatch for this fleets, therefore national quota did not allocate to them due to difficulties in practical.

Annual number of Indonesia tuna longline vessels included on the CCSBT Record of Vessel Authorized to Fish for SBT is shown in the Table 1. Number of vessel is fluctuated due to validity period of their fishing permit is different each other.

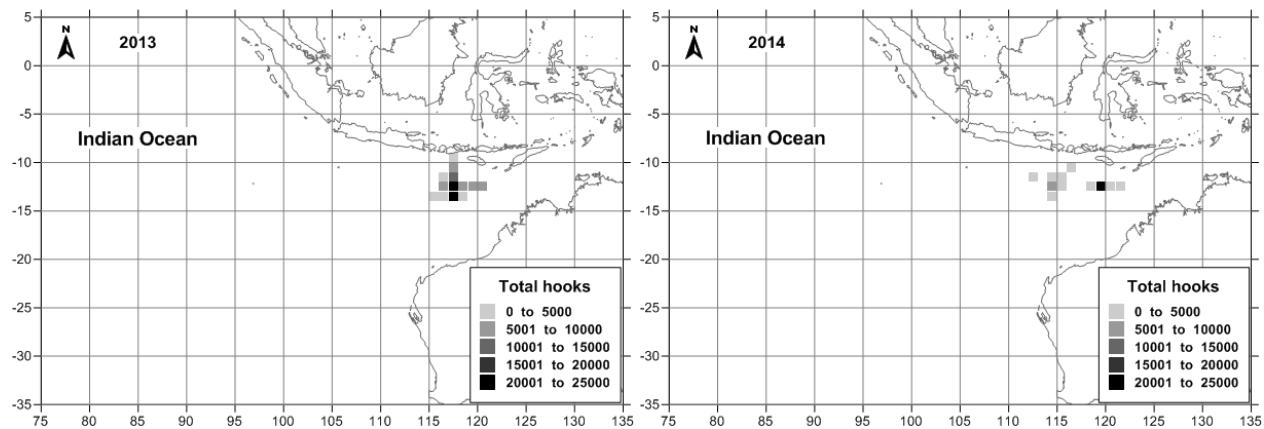

In 2013 and 2014, there were 386 and 336 tuna longlines vessel were included on the CCSBT Record of Vessel Authorized to fish for SBT. All vessels are greater than 30 GT. The total annual catch in 2013 and 2014 were 1,382,645 Kgs and 642,845 Kgs (temporary figure) respectively.

In 2013, catch was taken from the CCSBT statistical area 1 ( 77.04%) and statistical area 2 (17.23 %) and statistical area 8 (5.29) and statistical area 9 (0.44%) of the total annual catch. While in 2014, catch was taken from CCSBT statistical area 1 ( 97.01%) and statistical area 2 (2.27%) and statistical area 8 (0.72) of the total annual catch.

### **3. Fisheries Monitoring for each fleet**

Indonesia commenced scientific observer program in 2005, it is not exclusively to SBT fishery but to tuna fishery. Scientific observer on-board will carry out its task in accordance with the template/guideline adopted by IOTC and CCSBT. In 2013, 4 observers had been deployed on-board and in 2014, only 2 observers had been deployed due to budget limitation. All tuna longline vessel were fishing in the CCSBT Statistical Area No. 1.

The observer coverage in 2013 and 2014 was 0.16 % and 0.07 % respectively, as shown in Table 2. All data collected by observer was validated by a group of scientist from Research Center of Fisheries Management and Conservation. During the trip, they observed and collected data based on the template as far as possible, such as number of catch, discard/release (dead or live), species composition, gear type, catch and effort including biological data, etc. Catch and Effort data was daily recorded in the fishing logbook and reported to the principal of base-port.

To increase data collection by observer on-board as required by RFMO such IOTC and CCSBT, since 2013 Directorate General of Capture Fisheries has established national observer program. Under this program, there are 6 (six) tuna longline vessels had been observed in 2014, of which the collected data need to be further validated by the scientists from Reserach Center of Fisheries Management and Conservation, particularly in species identification such as sharks, ray as well as other spcesies.

#### **4. Sea-Birds**

There was no sea-birds caught during the observed period.

#### **5. Other non-target species**

Total number of non-target species such as sharks, ray and marine turtle by species was caught is shown in Table 3. In 2013, A total of 53 individuals sharks were caught, 8 species were recorded as specified in the table. A total of 518 individuals of rays were caught, 2 species was recorded and 53 out of them were alive released. A total of 23 individuals of marine turtle were cuaght, 2 species were recorded and 17 were alive released.

In 2014, A total of 13 individuals sharks were caught, 3 species were recorded as specified in the Table 3. A total of 236 individuals of rays were caught, 1 species were recorded. A total of 1 individuals of marine turtle was caught and it was alive released.

#### **6. Marine mammal and marine reptile**

There was no inraction with marine mammal and marine reptile.

#### **7. Mitigation measures to seabirds and other species bycatch.**

In accordance with Ministrial Regulation No. 12/2002, it is mandatory for each tuna longline vessel to implement mitigation measure to seabirds when they are fishing in south of 25° S. The option of night setting, seabirds scalling line and weight line has become a requirement. In relation to mitigation measure on marine turtle, it is a requirement for tuna longline vessel to carry on-board a necessary equipment to appropraite release of marine turtle caught incidentally, such as de-hooker, line-cutting and scope net.

## **8. Public awareness building activities**

Awareness building activity to protect ERS and bycatch such as marine turtle, seabirds and sharks, has been developed in form of printing material such as poster and leaflet. This material has been widely distributed to all stakeholders of tuna fisheries, particularly in Bali and Jakarta where SBT is commonly landed. The printing material as shown in Table 4.

## **9. Information on other ERS (non-bycatch) such as prey and predator species**

There was no interaction with prey and predator species.

## **10. Implementation of IPOA Seabirds and IPOA Sharks**

Indonesia is drafting national legislation to implement IPOA Seabirds and is at the final process to adopt IPOA Sharks into its national legislation.

## **11. Others**

The list of whole species observed by observer is shown in the Table 5.

Tabel 1 : Annual Number of Indonesia Longline Vessel fishing for Tuna including SBT  
And Annual Catch of SBT catches in the CCSBT Convention Area, 2008-2014

Year	Number of Longline Vessel	Estimated Catch (Kgs)
2009	438	640,681
2010	272	635,555
2011	274	842,397
2012	317	909,755
2013	386	1,382,645
2014	336	642,845*

Note : \* temporary figure

Tabel 2 : Observer Coverage of SBT Catch and Hooks observed under Indonesia Observer Program, 2013-2014

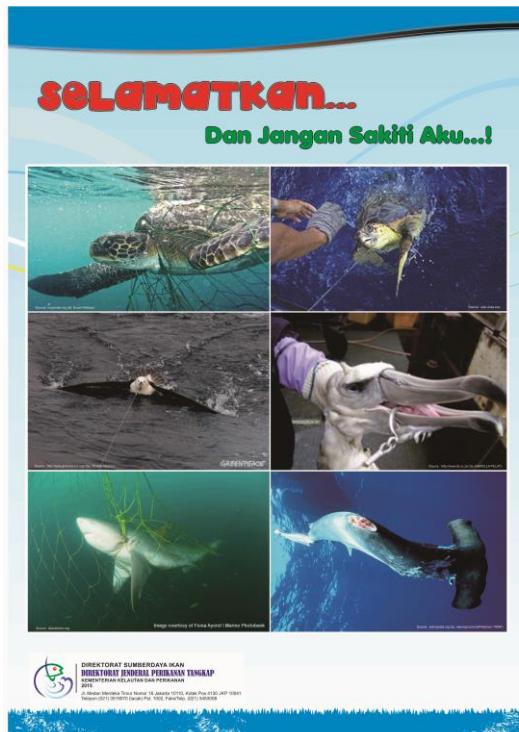

Year	Vessels Observed	Hooks Observed (x1000)	Total Hooks Estimated (x1000)	Catch Observed SBT (n)	Coverage (%)
2013	4	145.8	92.640	25	0.16
2014	2	54.2	80.640	12	0.07

Table 4. Public Awareness Building Activities

a. Poster

b. Leaflet

**Circle Hook**

Circle hook pada perikanan tuna longline telah terbukti dapat mengurangi jumlah bycatch penyatu laut. Dari hasil uji coba, diperlukan jumlah yang menggunakan circle hook pada tuna longline, jumlah had tangkap tuna tidak mengalami penurunan, sedangkan dengan penyatu laut telah terbukti berkurang sekitar 40%.

**Troll Line atau Streamer Lines**

Troll line merupakan teknologi pancing jala atau tali yang dimaksud pada bagian belakang kapal tuna longline, biasanya diberi pemberat dan pemungkung sehingga ketika kapal berlayar, tali ini akan menyerap daya tarik gravitasi bumi sehingga tidak menarik burung laut tetapi tidak mendekat dan tidak memangsa umpan ketika setting sedang dilakukan.

**Hal Lain yang Harus Diperhatikan untuk Mengurangi Ter tangkapnya Bycatch**

Dilansir tindakan mitigasi sebagaimana telah diuraikan diatas, terdapat faktor lain yang harus diperhatikan dalam upaya mengurangi tangkapan bycatch seperti:

- Menjaga jarak antara perangkap ikan juga dapat mengurangi jumlah bycatch. Tindakan ini dapat dilakukan, misalkan, dengan memasang legatan perangkap ikan agar tidak terlalu dekat dengan tangkapan ikan tersebut, khususnya untuk ikan ilmiah, patut dilupus pada saat itu terjadi migrasi bycatch ke kawasan tersebut.
- Pelajaran cara pemangkapan ikan yang mencakup lingkungan

Pelajaran cara pemangkapan ikan yang mencakup lingkungan dan ekosistem, seperti bora ikan dan potasium fokus, wajib ditegakkan secara hukum. Tindakan ini menjadi satu-satunya jalan untuk mendidik kesadaran hayati, ekosistem dan lingungan di bawahair.

**INFORMASI**

Direktorat Sumberdaya Ikan  
Direktorat Sumberdaya dan Pengembangan  
Konservasi, Kehutanan dan Perikanan

**TINDAKAN MITIGASI TERHADAP HASIL TANGKAPAN SAMPINGAN (BYCATCH) DALAM PERIKANAN TUNA**

**Pendahuluan**

Perjanjian Internasional the United Nation Fish Stocks Agreement 1995 telah menetapkan prinsip dan pengelolaan sedian ikan yang berbasis jadil bagi menjaga stabilitas dan kelanjutan sumber daya alam. Prinsip ini berlaku bagi seluruh negara yang secara teknis pengelolaan berdasarkan prinsip acuan (reference point). Sejauh ini 70 negara, dan Uni Eropa telah membuat Undang-Undang mengenai perikanan, termasuk Indonesia melalui Undang-Undang Nomor 21 Tahun 2009. Perjanjian Internasional tersebut mengharuskan setiap negara mengambil berbagai tindakan mitigasi terhadap tangkapan ikan yang bersifat bersifat dengan tuna (Ecologically Related Species - ERS). Ofis setelah itu, Resolusi Resolusi mengenai Organisasi Penerbangan dan Manajemen terhadap tindakan mitigasi dan manajemen terhadap tindakan mitigasi terhadap bycatch dan ERS menjadikan salah satu indikator keberhasilan pengelolaan sumber daya kelautan.

**Pengertian Bycatch dan ERS**

Hasil tangkap sampeyan (bycatch) dalam perikanan tuna adalah hasil tangkapan ikan yang tidak menjadi target sasaran (non-target species) ketika perangkap ikan. Secara teknis, ikan yang termasuk dalam kategori ERS adalah jenis spesies lain yang secara biologis berkaitan dengan tuna (Ecologically Related Species - ERS). Ofis setelah itu, Resolusi Resolusi mengenai Organisasi Penerbangan dan Manajemen terhadap tindakan mitigasi dan manajemen terhadap tindakan mitigasi terhadap bycatch dan ERS menjadikan salah satu indikator keberhasilan pengelolaan sumber daya kelautan.

**Pengamanan Hasil Tangkapan Sampingan**

Target utama hasil tangkapan (target species) perikanan tuna di Indonesia umumnya dicantumkan 3 (tiga) jenis yaitu Madidih (Yellowfin tuna), Tuna mata besar (bigeye tuna) dan Albokora (skipjack tuna), namun juga terdapat tangkap tuna strip ikan selatan (Southern bluefin tuna) dan Albokora (Albacore).

**Tindakan Mitigasi Bycatch**

Pengurangan sebagai tindakan mitigasi bycatch telah dipromosikan secara luas, seperti:

- Light Stick pada Alat Tangkap Jaring Instang Pantai (Coastal Gillnet)**

Light stick dapat dipergunakan untuk mengurangi ter tangkapnya penyatu laut sebagai bycatch. Selain itu, light stick juga dapat memberikan pengaruh terhadap cahaya dan biota yang membiak saat melihat penceran cahaya pada permukaan laut di malam hari. Rencananya penyatu laut telah dihadirkan di atas dunia dengan teknologi cahaya yang terangkapnya penyatu laut pada jaring instang pantai, dengan cara menggunakan sejenis lampu (light stick) pada jaring tersebut.

Cahaya tersebut, sudah menjadi kewajiban setiap pemilik kapal dan/atau nakhoda dan/atau anak buah kapal untuk melakukan perangkap yang baik (bertinggi gunjawa) terhadap hasil tangkapan sampingan (bycatch) dengan tujuan:

- meningkatkan peluang hidup bycatch yang dilepaskan selama dalam perangkap
- mengurangi kerusakan pada kawanan hayati dan sumberdaya perikanan serta ekosistem laut;
- memberikan citra positif bagi perikanan tuna yang menerapkan praktik-praktik tindakan mitigasi
